

TURF REPLACEMENT KIT INSTRUCTIONS

- Measure and mark area of turf to be removed from your True Pitch Portable Mound.
- With an exacto knife or an utility knife, cut the turf all the way through to the mound fiberglass shell.
- Please note that the glue that we use on our portable mounds is a very strong adhesive and it will take some effort to pull off existing turf so we recommend the following steps.
 - Start at a corner and with a pair of pliers grab the turf and start pulling towards you. This step may require another individual to help pry up turf at same time with a putty knife, pry bar, or a flat bar.
 - After the turf is removed, scrape off any remaining glue with a putty knife or a sandblock.
- After mound is clean and dry, apply an even thin layer of glue to the turf backing and the mound surface with a brush or a paint mixing stick. Remember, it is very important to wear protective rubber gloves during this process.
- Place turf on the mound and smooth out. Allow to cure for 7 days before use. Weight may be needed to place on the turf during the drying process.
- Any unused glue in the container must be immediately sealed and stored at room temperature.
