Turf Replacement Kit Instructions

Measure and mark area of turf to be removed from your True Pitch Portable Mound. With an exacto knife or an utility knife, cut the turf all the way through to the mound fiberglass shell. The glue that we use on our portable mounds is a very strong adhesive and it will take some effort to pull off existing turf so we recommend the following steps. Start at a corner and with a pair of pliers grab the turf and start pulling towards you. This step may require another individual to help pry up turf at same time with a putty knife, pry bar, or a flat bar. After the turf is removed, scrape off any remaining glue with a putty knife or a sandblock.

After mound is clean and dry, apply an even thin layer of glue to the turf backing and the mound surface with a brush or a paint mixing stick. Remember, it is very important to wear protective rubber gloves during this process. Place turf on the mound and smooth out. Allow to cure for 7 days before use. Weight may be needed to place on the turf during the drying process.

Any unused glue in the container must be immediately sealed and stored in room temperature.
